OUTPUT SCREENSHOTS

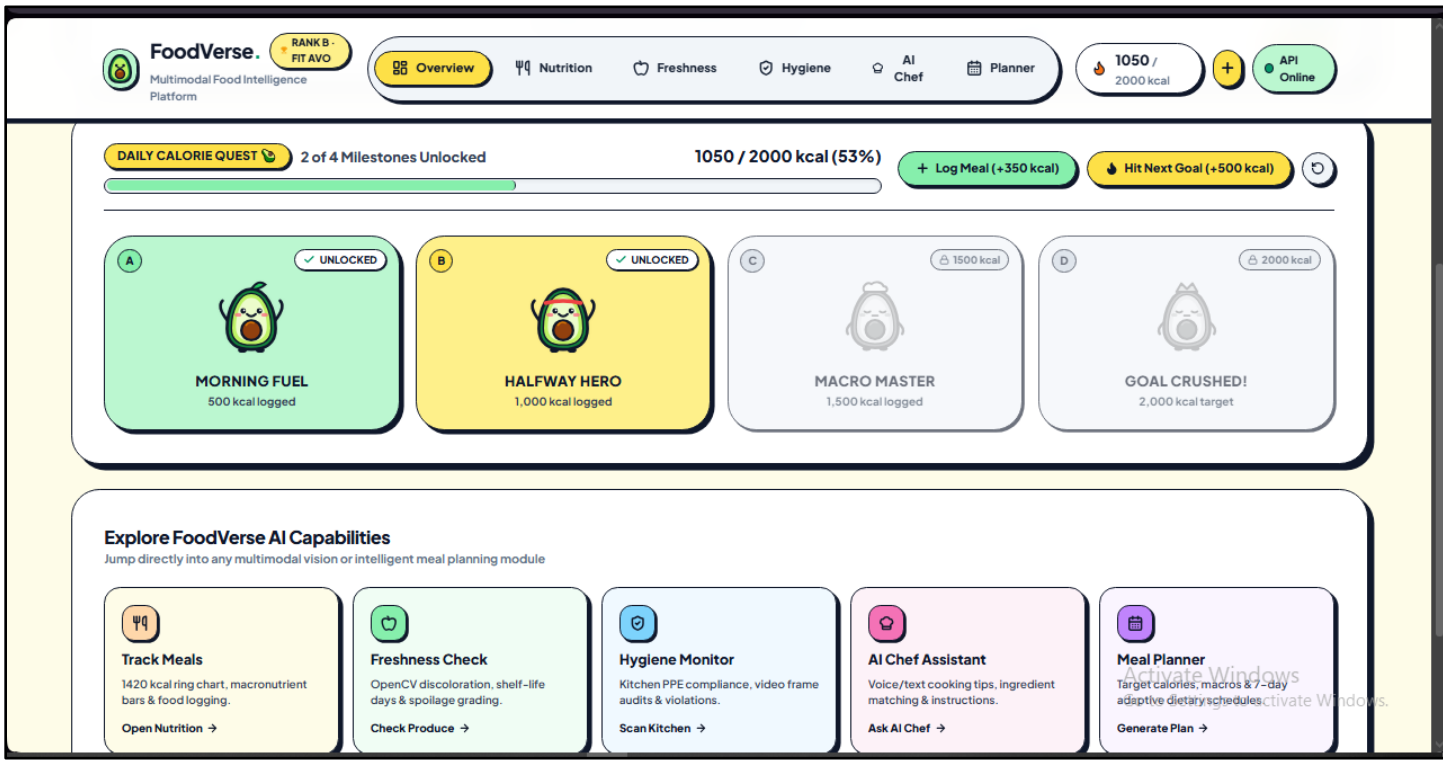

1) Food Verse Dashboard

The primary landing module greets users with their daily metabolic targets. It prominently features a sleek caloric progress bar, the active TDEE calibration, and real-time backend system status indicators.

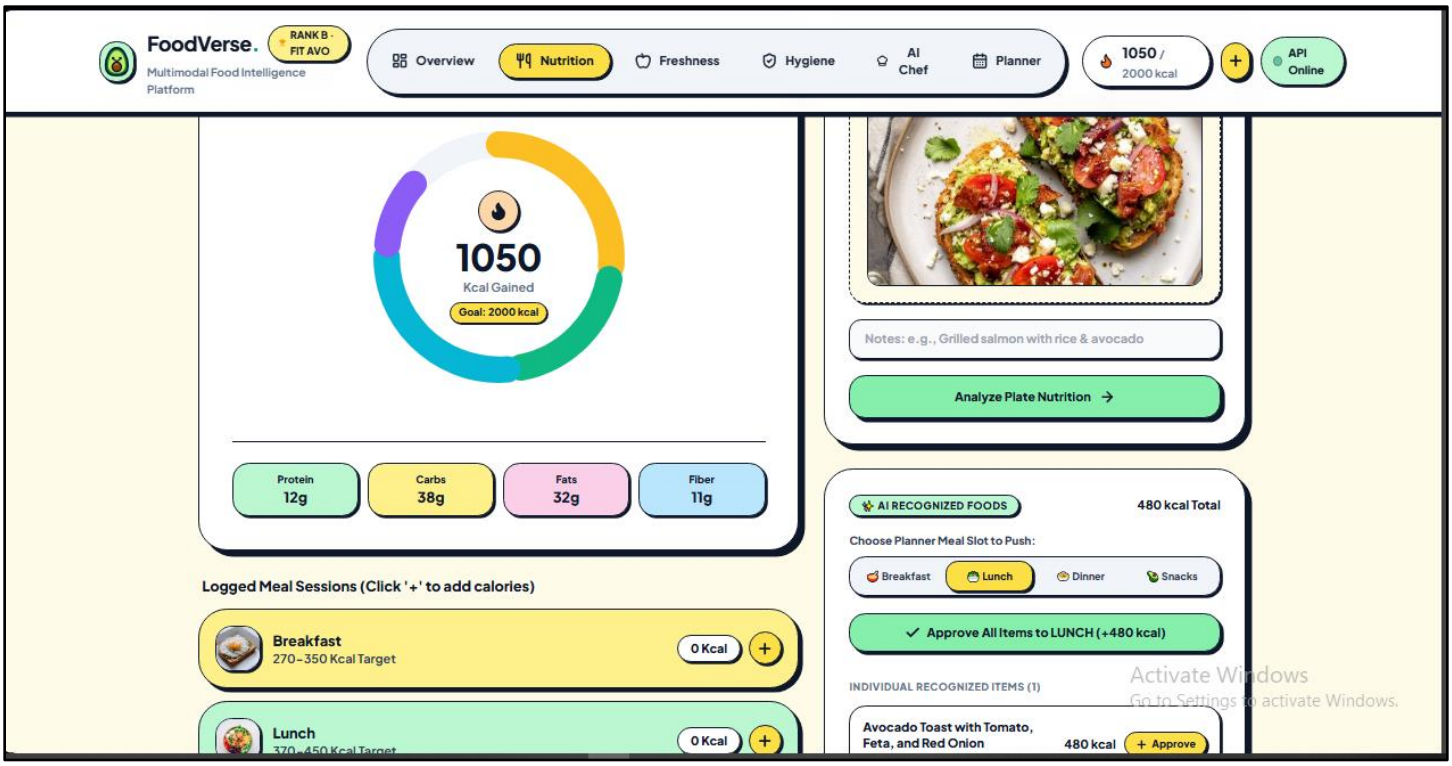

2) Gamified Calorie Quest

Designed to maintain user engagement, this section translates dietary targets into a milestone-based visual journey, unlocking achievement cards (e.g., "Morning Fuel", "Macro Master") as goals are met.

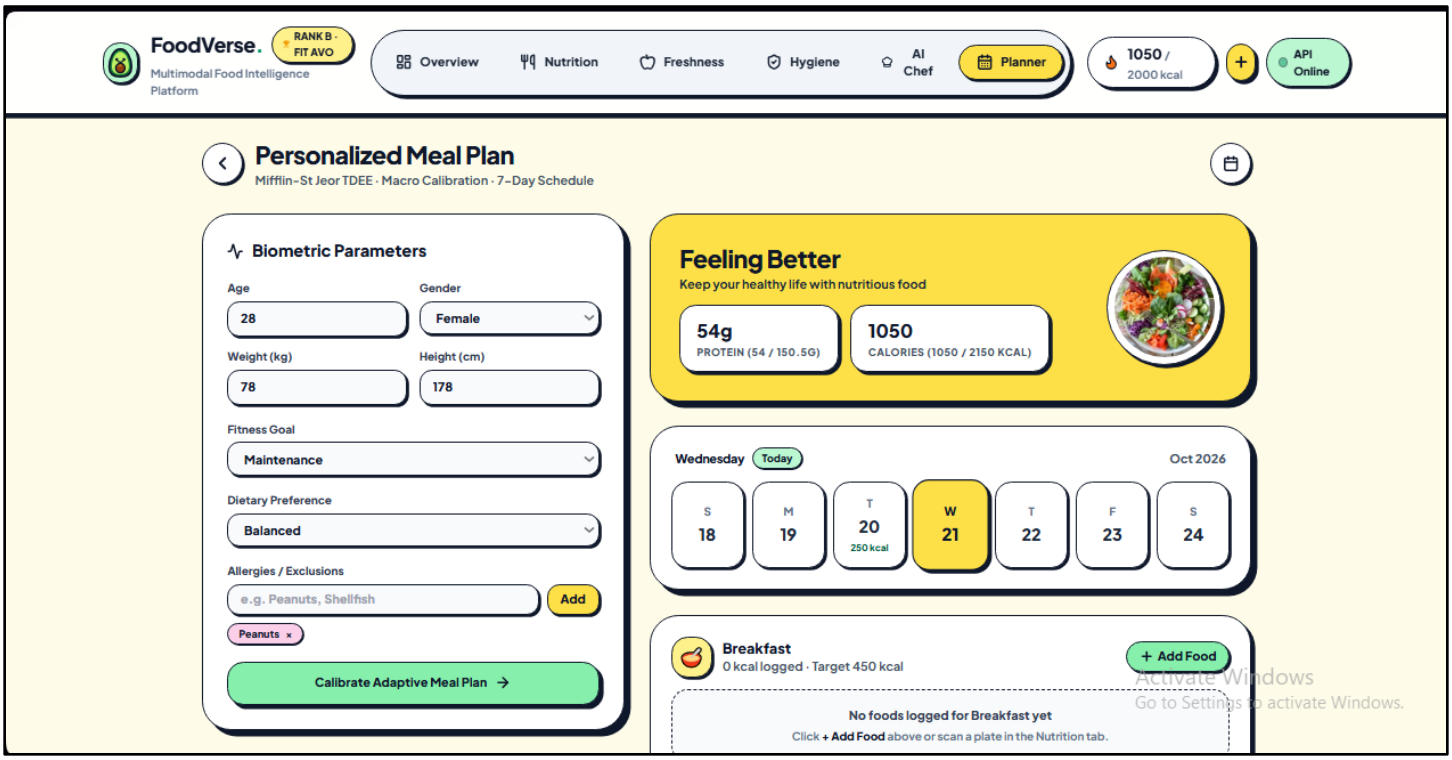

3) AI Plate Analysis & Nutrition Breakdown

The nutrition vision engine dissects uploaded meal photography (like Avocado Toast) to accurately estimate portion sizes and macro distributions (Protein, Carbs, Fats, Fiber) directly from image pixels

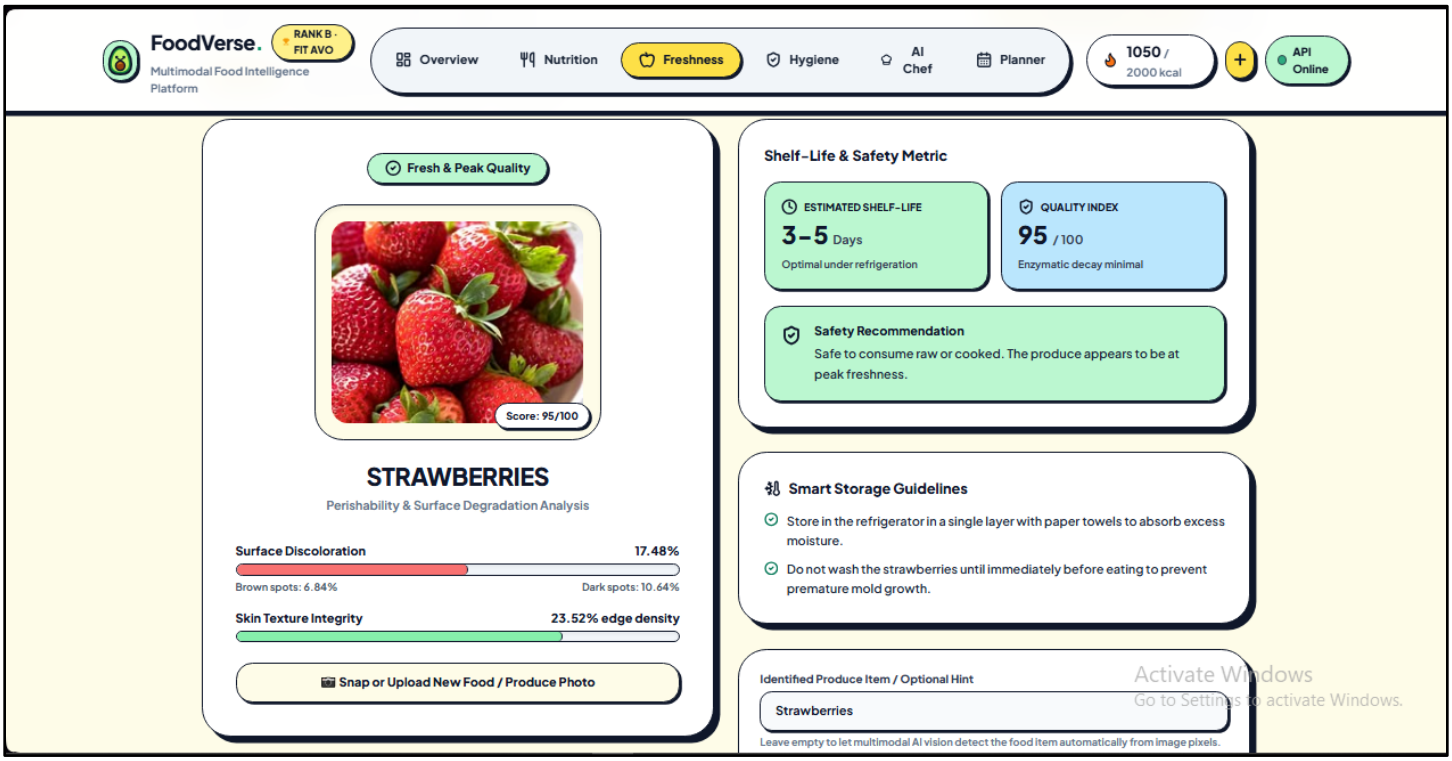

4) Personalized Meal Planner Engine

Users input detailed biometrics, fitness goals, and allergies. The system uses clinical formulas alongside the LLaMA engine to schedule an entire week's worth of fully macro-calibrated meals.

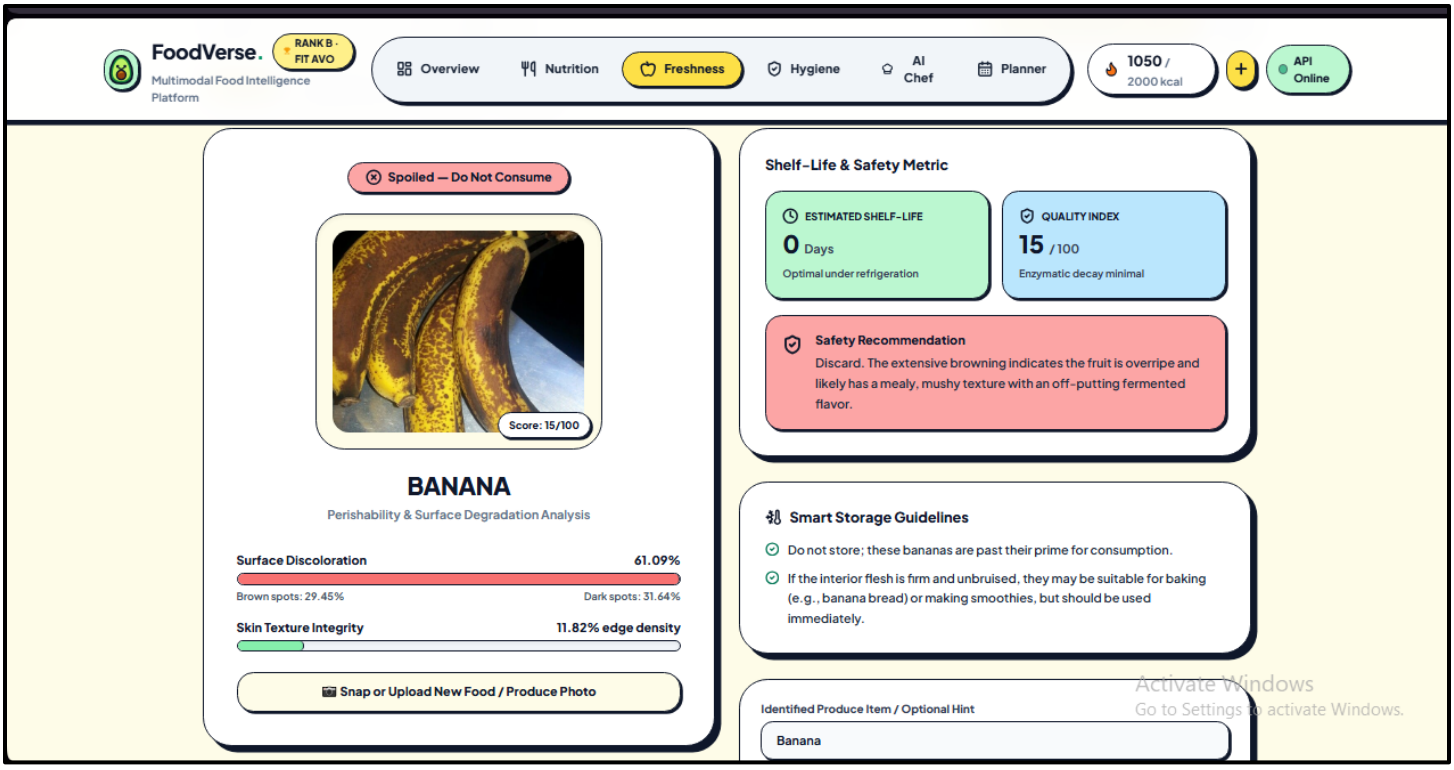

5) Freshness AI: Peak Quality Detection

When analyzing fresh produce like strawberries, the computer vision backend assesses surface discoloration and skin texture integrity to generate an exact Quality Index and actionable storage guidelines.

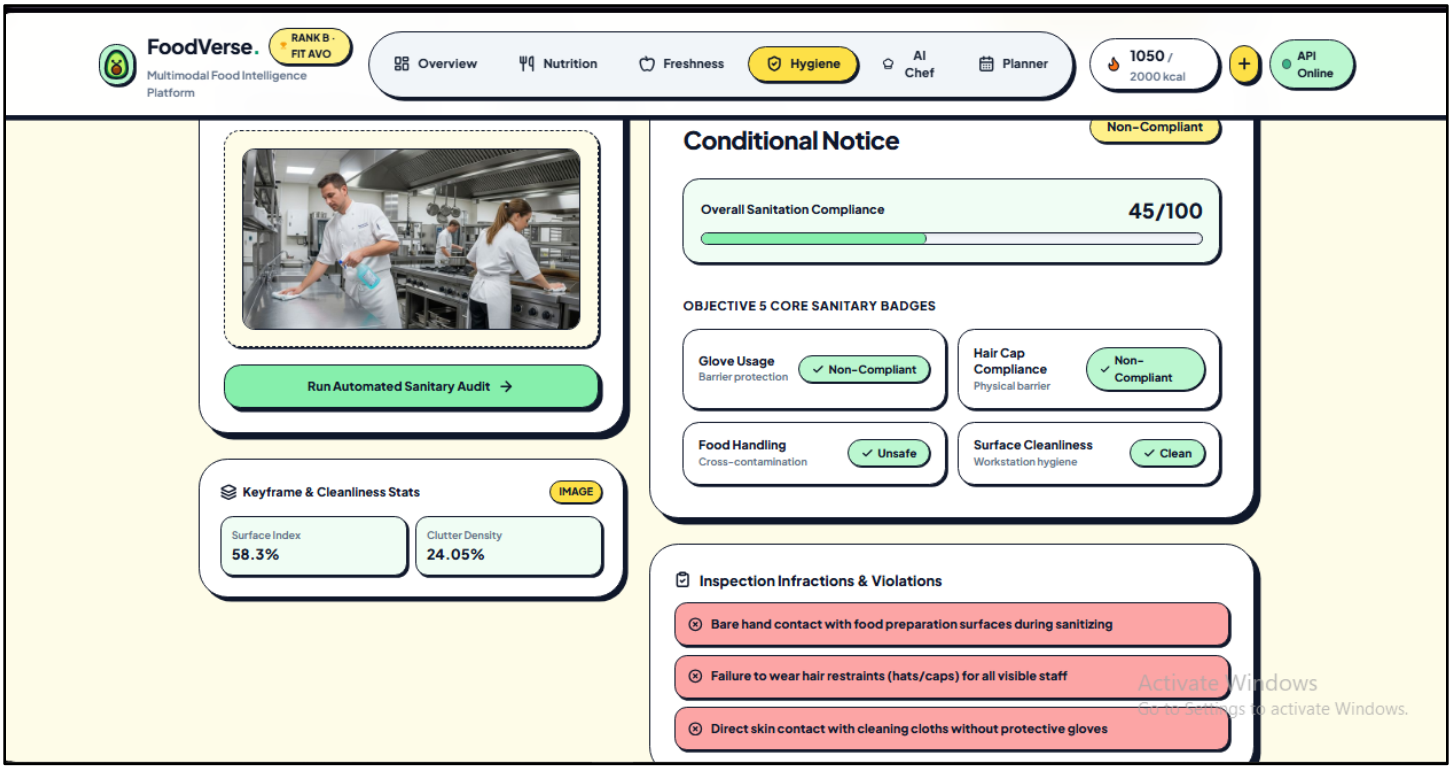

5.1)Freshness AI: Spoilage & Discard Warning

The system robustly identifies severe enzymatic decay and extensive oxidation. In this scan of overripe bananas, the AI correctly drops the score and issues a critical safety recommendation to discard.

6) Commercial Hygiene & Safety Monitor

This module evaluates kitchen workstation snapshots for health code compliance. The AI identifies specific violations such as lack of hair restraints and unsafe bare-hand food contact during prep.

7) AI Chef: Multimodal Recipe Generation

Users can submit culinary requests via text, voice audio (Groq Whisper), or pantry photos. The AI curates a personalized recipe complete with prep times, macro targets, and a precise ingredient list.
